Etched with 5 per cent. picric acid in alcohol. Therefore, there are left the effects caused by non-emulsified inclusions upon the behavior of steel when subjected to the ordinary physical tests usually specified. Of these extraordinarily various examples I will give only two. The first is afforded by a medium hard 2-per cent. nickel steel containing non-metallic inclusions of large dimension united in groups which forged down into elongated shapes looking like stripes in the micrograph. Figure 34, enlarged 70 dia. after etching with 5 per cent. alcoholic solution of picric acid, reproduces the appearance of such a group of inclusions taken after a very accurate and efficacious heat treatment has eliminated (by a process which we shall see further on in regard to the emulsified inclusions) the large strip of ferrite which had collected around the group in the forged steel, due to the phenomena seen in Sec. 98. Now, in spite of the efficiency of the homogeneity heat treatment, proved by the elimination of this ferrite accumulation, the inclusions continue to exercise very intense local effects easily detected in the tension tests made upon the metal by means of transverse test-bars taken with their longitudinal axis perpendicular to the direction of the elongation produced by forging. Some tension tests made upon a certain number of test-pieces whose fractures did not present any anomaly, gave satisfactory results varying between the following limits: Tensile strength 92,000 to 101,000 Elastic...
